

# Breakout / Lab 10

Remove - **AKA, Be Careful and Do Not Accidentally Delete Your Nike Account**

Last Updated: March 26, 2017

## Problem / Exercise

For this lab, you will implement your own version of the `rm` systems program, a standard Unix utility that *attempts* to remove files or directory files using the `unlink(2)` and `rmdir(2)` system calls. If the permissions of the file do not permit writing, and the standard input device is a terminal, the user is prompted (on the standard error output) for confirmation. The command-syntax is:

```
$ ./rm [-rf] [file...]
```

Your implementation should match the output of the existing `rm` utility. The `-r` option causes `rm` to attempt to recursively remove the file hierarchy rooted in each file argument (see `opendir(3)`, `readdir(3)`, and `closedir(3)`). If the user does not respond affirmatively, the file hierarchy rooted in that directory is skipped. The `-f` option causes `rm` to assume affirmative responses from the user, foregoing any prompting. **Take special precautions NOT to recurse on the `..` directory entry.**

You are **NOT** allowed to use the `exec`, `system`, `popen`, and `pclose` system calls or functions in your implementation. You are not allowed to call the existing `rm` implementation. You must supply your own implementation that uses low-level file I/O (APUE Ch. 3), if needed.

## 1 Group Brainstorm

Breakup into groups based on your seating and brainstorm about how to solve the problem or exercise. Make sure everyone understands the problem, and sketch out potential ways to move towards a solution. Perhaps something that was discussed during lecture might be useful? **NOTE:** Are you creating your own implementation of an existing systems program? If so, then you will probably benefit from experimenting with the existing program in order to see how it works.

## 2 Submit Individual Brainstorm

Login to eLC and submit a version of your group's brainstorm, written in your own words. You may add additional information if you want. You need to write enough in order to convince the grader that you understand the problem or exercise and that you have a plan for moving forward towards a solution. Please include the last names of the other people in your group in your submission. The brainstorm submission should be available on eLC in your assignment dropbox. We prefer that you submit your individual brainstorms before the end of your breakout period, however, you generally have until 11:55 PM on Friday during the week of your breakout (as indicated on eLC) to submit them. **NOTE:** Submissions that do not include an individual brainstorm will not be graded.

## 3 Submission

Before your next breakout lab session, you need to submit your code. You will still be submitting your project via nike. Make sure your work is on `nike.cs.uga.edu` in a directory called `LastName-FirstName-lab10`. From within the parent directory, execute the following command:

```
$ submit LastName-FirstName-lab10 cs1730a
```

It is also a good idea to email a copy to yourself. To do this, simply execute the following command, replacing the email address with your email address:

```
$ tar zcvf LastName-FirstName-lab10.tar.gz LastName-FirstName-lab10
$ mutt -s "lab10" -a LastName-FirstName-lab10.tar.gz -- your@email.com < /dev/null
```

## 4 Some Nonfunctional Requirements

Your submission needs to satisfy the following nonfunctional requirements:

- **Directory Setup:** Make sure that all of your files are in a directory called `LastName-FirstName-lab10`, where `LastName` and `FirstName` are replaced with your actual last name and first name, respectively.
- **Libraries:** You are allowed to use any of the C or C++ standard libraries. When reading or writing to a file are concerned, you need to use low-level calls to `read(2)` and `write(2)` and related functions. You are NOT allowed to use the following system calls in any of your implementations: `fork(2)`, `execve(2)`, `exec(3)`, `popen(3)`, and `system(3)` (or related functions).
- **Unbuffered Output:** Whenever possible, program output should be unbuffered. The best way to guarantee that output is unbuffered (i.e., characters at the destination as soon as possible) is to directly call `write(2)`. If you are using `printf(3)`, you should disable output buffering using `setvbuf(3)`. If you are using C++ output streams (e.g., `cout`), then you should disable output buffering using `setf` `&cout` and `unitbuf` `&cout`.
- **Documentation:** All classes, structs, and functions must be documented using Javadoc (or Doxygen) style comments. Use inline documentation, as needed, to explain ambiguous or tricky parts of your code.
- **Makefile File:** You need to include a `Makefile`. Your `Makefile` needs to compile and link separately. That is, make sure that your `Makefile` is setup so that your `.cpp` files each compile to individual `.o` files. This is very important.
- **Standards & Flags:** Make sure that when you compile, you pass the following options to `g++` in addition to the `-c` option:

```
-Wall -std=c++14 -g -O0 -pedantic-errors
```

Other compiler/linker options may be needed in addition to the ones mentioned above. The expectation is that the grader should be able to type `make clean` and `make` in the following to clean and compile/link your submission, respectively.

- **README File:** Make sure to include a `README` file that includes the following information presented in a reasonably formatted way:
  - Your Name and 810/811#
  - Instructions on how to compile and run your program.
  - Reflection

Make sure that each line in your `README` file does not exceed 80 characters. Do not assume line-wrapping. Please manually insert a line break if a line exceeds 80 characters.

- **Compiler Warnings:** Since you should be compiling with both the `-Wall` and `-pedantic-errors` options, your code is expected to compile without `g++` issuing any warnings.
- **Memory Leaks:** Since this assignment may make use of dynamic memory allocation, you are expected to ensure that your implementation does not result in any memory leaks. We will test for memory leaks using the `valgrind` utility.
